

Title: Barangay Senior Citizen Monitoring System

Introduction

Senior citizens are an important sector of the community and require proper monitoring to ensure they receive the benefits, care, and services they are entitled to. In many barangays, records of senior citizens are still managed manually, which can lead to disorganized data, difficulty in tracking benefits, and delays in providing assistance.

The proposed **Barangay Senior Citizen Monitoring System** aims to digitize and streamline the management of senior citizen records. By implementing a computerized system, barangay officials can efficiently store, update, and monitor information such as personal details and benefits received.

This project focuses on developing a system that allows easy recording, tracking, and reporting of senior citizen data. It will help improve service delivery, ensure proper distribution of benefits, and enhance the overall welfare of senior citizens.

Statement of the Problem

The current system for managing senior citizen information faces several issues:

- Manual recording leads to incomplete or outdated records
- Difficulty in tracking benefits and assistance provided
- Lack of centralized database for senior citizens
- Delays in identifying seniors who need support
- Limited access to accurate reports and data

Key Questions:

- How can senior citizen data be recorded and updated efficiently?
- How can the system help track benefits and assistance?
- How can barangay officials easily monitor senior citizens' needs?
- How can data be stored securely and accessed quickly?

Objectives of the Study

General Objective:

To develop a Barangay Senior Citizen Monitoring System that improves the management, tracking, and delivery of services for senior citizens.

Specific Objectives:

- To create a system for digital recording of senior citizen data
- To monitor benefits and assistance provided
- To generate reports and summaries of senior citizen records
- To ensure secure storage of sensitive information
- To improve identification of senior citizens needing support
- To enhance service efficiency and accuracy

Scope and Limitations

The system is designed for use by barangay staff and authorized personnel to efficiently manage senior citizen information. It includes features such as senior citizen profiling, benefits and assistance tracking, report generation, and search and filtering of records. The system will be implemented in a specific barangay.

However, the system has certain limitations. It is limited to record management and tracking only, may be accessible only within the barangay office if developed as an offline system, and does not integrate with national health databases.

Methodology

Research Design:

Mixed-method approach (qualitative and quantitative)

Data Collection:

- Interviews with barangay officials and senior citizens
- Observation of current record-keeping process
- Surveys for feedback

Tools/Software:

- Programming Language: Python

Development Process (SDLC Model):

- Requirement Analysis
- System Design
- Implementation
- Testing
- Deployment
- Maintenance

Data Analysis:

Evaluate system performance through testing

Validate results based on feedback

SDG Integration

This project supports:

SDG 3: Good Health and Well-being

Promotes better monitoring of senior citizen welfare

SDG 10: Reduced Inequalities

Ensures equal access to benefits and services

SDG 16: Peace, Justice, and Strong Institutions

Improves transparency and efficiency in service delivery
